Work Experience

2018-Present **Field Architect**, *Cambridge Semantics*, Boston, MA.
- Responsible for overall technical delivery of complex data integrations
- Manage a team focused on product delivery
- Work with customers' technical teams to design solutions around customer requirements and product capabilities
- Design and execute on building knowledge graphs in enterprise environments

2016-2018 **Associate Staff**, *MIT Lincoln Lab*, Lexington, MA.
- Designed and implemented a framework for secure multi-party computation, a privacy-enhancing, cryptography-based technology for computing analytics while preserving the privacy of inputs.
- The design and implementation involved novel cryptographic optimizations, concurrent and parallelized code, and a uniquely tailored test harness.

2016 **Software Engineer**, *Sailfan*, Portland, OR.
- Researched and developed algorithms and software to detect features in images and compute statistics in domains with a limited training set.
- Implemented a RESTful interface for clients to interact with the image processing code.

2015–2016 **Research Assistant**, *Reed College*, Portland, OR.
- Worked with professor Adam Groce on Oblivious RAM (ORAM), a cryptographic technique for obfuscating a client's access patterns to a server.
- Implemented ORAM protocols in C++, wrote cryptographic proofs that the protocols were secure, and published a paper.
- Worked with professor Anna Ritz on identifying structural variants in DNA using Python and graph analytics.

Education

2016–2017 **Student**, *MIT*, Cambridge, MA.
Participated in classes at MIT including Lattice Cryptography with Vinod Vaikuntanathan, Public Ledgers with Silvio Micali, and Multicore Programming with Nir Shavit.

2012–2016 **Bachelor of Arts in Math-Computer Science**, *Reed College*.

Thesis *Implementing Component-Based Garbled Circuits*

Advisor Professor Adam Groce

Description Explores methods of secure computation, a cryptographic protocol for allowing two people who do not trust each other to work together. I developed a new technique for chaining components of Yao's garbled circuits, and I implemented the technique in C to achieve an order of magnitude speed up over prior work.
